Education

University College Dublin **Expected Graduation: 06/2027**
BSc Computer Science with Data Science and AI *Dublin, Ireland*
Relevant Coursework: Algorithms, Data Structures, OOP, Databases & Info Systems Expected Grade: **1:1 Honours**

Technical Skills

Languages: TypeScript, Python, Java, SQL, Bash, HTML, CSS, Swift, Scala
Tools and technologies: React, Next.js, PostgreSQL, Firebase, Tailwind, Figma, JUnit, Docker, Git, Vercel
Practices: Unit & component testing (Vitest, React Testing Library, JUnit), Webhooks, REST APIs

Experience

Technical Product Manager Intern **March 2026 - September 2026**
IBM *Dublin, Ireland*
- Built product dashboards surfacing sales and pipeline metrics, using static (**HTML/JavaScript**) and **React** frontends backed by **PostgreSQL** and containerised with **Docker.**
- Built **Jiramon** (see Projects) to sync ticket progress between Jira and Monday.com, saving a 4-person PM team an estimated **~4 hours a week** of manual double entry.
- Owned end-to-end delivery of a product feature for the NS1 Connect customer-facing portal, coordinating design handoff, writing tickets, running sync calls, and tracking progress to release.
- Received a return offer as a **Software Developer** for 2027.

Freelance Web Developer **June 2025 - March 2026**
Self-Employed
- Delivered a **Next.js/TypeScript** website for Pension & Financial, a financial advisory firm, with a Sanity CMS (custom schemas for 9 page types) so the client could edit content without a developer; live for **~1 year**.
- Identified edge cases in client-entered content (empty, null, oversized, special characters) and ensured each was handled, keeping the site up during CMS outages.
- Covered these cases in a **121-test Vitest + React Testing Library** suite with a mocked CMS client.
- Built a secret-protected webhook endpoint so CMS edits publish instantly, with tests for missing or invalid secrets.

Technical Assistant **July 2025 - September 2025**
Gromtec Europe *Bray, Co. Wicklow*
- Automated WooCommerce price updates for 32 products, reducing update time from **over 60 to under 6 minutes**.

Summer Intern **May 2024 - September 2024**
Ronan Group Real Estate *Dublin*
- Facilitated the transfer of company database to cloud servers, reducing company expenses by **€2,500+** per year.
- Researched AI relevance for the business, helping drive **companywide adoption of LLMs** for basic task support.

Projects

IBM Bob Widget | Desktop App **TypeScript | Electron | Node.js | Lottie**
- Built an **Electron/Node.js** desktop app that tracks IBM's Bob LLM agent in real time by parsing its output files, so users could follow long-running tasks and approve steps without reading logs.

Jiramon | Jira/Monday.com sync service **TypeScript | Node.js | Docker**
- Built a bidirectional sync service that receives **webhooks** from both Jira and Monday.com, maps items between their data models, and writes changes back via each platform's API (**REST** for Jira, **GraphQL** for Monday).
- Added a background job that turns **CI/CD** failures into Jira tickets; containerised with **Docker** on **IBM Cloud**.
- Tested sync **end-to-end** with dummy boards in Jira and Monday.com, checking updates in both directions.

LeapFrog | iOS live transit map HackUCD 2026 | **Swift | SwiftUI | GTFS-Realtime**
- Built an iOS app showing live Dublin buses, Luas and DART locations on one map, merging three real-time feeds (NTA, Irish Rail, Luas) with source priority, fallbacks and stale-data filtering.
- Bus pings arrive 45-90s late, so built a tracker that snaps each ping to its route and moves the bus forward at timetable pace; tuned against real NTA data, **cutting median position error by 21-43%** versus raw pings.
- Added an LLM assistant that answers questions using live snapshots of delays, cancellations and line status.
- Created a synthetic feed of 1,500 moving buses to load-test the map without using the API's rate limit.

Hex Oust | Game **Java | Swing | JUnit**
- Led a 3-person team building an **MVC** hex-grid game in Java/Swing.
- Wrote **54 JUnit 5 tests** covering hex-grid maths, capture and turn rules, win detection and invalid moves, using a GUI test double so game logic is tested without the UI.
